Historical SkyRelief hardware dossier with modern engineering reconstruction.

Source-supported components and connectivity are distinguished from new reference implementations.

Unrecovered pin assignments, firmware parameters and code must not be treated as as-built records or electrically validated flight instructions.

SOURCE-DERIVED logical block schematic. All open ports are intentional unresolved evidence boundaries.

Generic JHEMCU vendor graphic is not the installed GHF411/R81 harness and is not reproduced.

NO WIRES: C14-C18 roles are documented; no physical pins, voltage, pad order or protocol recovered.

Native ERC open-port findings are retained. No power flags or no-connect markers conceal missing harness.
